You probably have heard of Lightroom, but who has used it? If you answer that it's been primarily used by professionals and photographers on Windows by photographers, we'd ask if you have used Lightroom, at all? Have you tried Lightroom for photographers? What are your impressions about it? Do you use Photoshop? If so, why or why not? Lightroom is a photo editor that has a "simple to use" interface for both importing and exporting images and some basic editing features, such as basic trimming, cropping, and resizing. It has some basic advanced editing features, such as basic Color Balance and Exposure, but I prefer to stay out of that as much as possible. Lightroom's interface is easy to learn, but it does demand some familiarity with the concepts involved. It can be quite a bit of work to organize images if you want to outsource some work to post-processing programs, locally or online. Lightroom 4 addressed some of this, but most of the features in Lightroom 4 were further improved and/or expanded in Lightroom 5. The most significant changes in Lightroom 5 are: Script Mode makes it faster to work with a script, any script, to speed up your workflow. Learn scripting on www.photoshop.com. Other new features include eliminating borders and flash-like corrective brush tools. There are also performance/memory improvements, including the ability to work with larger images. It will be interesting to see those two areas of improvement. When working with more than three images, the automatic Find Edits function doesn't work. Instead, users get a literal Find and Replace dialog that re-identifies artifacts and objects in the photo. As of today, it's still more accurate than the default method of searching for objects in the photo. While the new version will do a better job of identifying objects in the background, I also wonder if it would be able to identify 3D objects as well.

Collaboration has never been easier. You can send someone an image as an attachment (known as a browser link, which opens the image in a new tab in a browser) or you can share design documents directly. If you're missing a bit in a given area, you can Paste and Merge. If you need a one-click crop option, you can drag a box around the desired section of your image, and you can crop to an exact percentage in a few simple taps. The latest versions of Photoshop Elements continue to play a vital role in the lives of thousands of designers, and with this update, they get smarter. Over the years, they've been able to properly group documents with similar graphic styles, and now, with the new Document Mover and Grouping features, you can connect documents that were once lost to each other. Grouping allows you to group a number of pages based on the page order along with an image that you can reuse throughout the document, and Document Mover allows you to pull a specific page from a document and move it to another one, without losing any formatting. One of the most asked for features over the years has been a one-click solution for removing a face from a photo. This is now possible in Photoshop, and all you need is some patience to perform the task. Simply drag a triangle over one of the eyes and drag down a little to remove it. While there may be a couple of ways to achieve the same result, this is the most reliable. **POWERPOINT** - Today, Adobe announced a revolutionary update in performance, connectivity, and design. Designers and creators can expect new features, enhanced accessibility, faster performance and more collaboration. With Project Aero, for the first time in PowerPoint, a user can interact with content in a browser without leaving PowerPoint. Additionally, PowerPoint Online allows professionals to work on content in the browser and collaborate with other team members—all in PowerPoint. The new features, combined with Spark improvements and performance enhancements will convert you to the new PowerPoint.
